Filoger Comprehensive Python For AI Course 2024

Score: 200 + 100(GitHub)
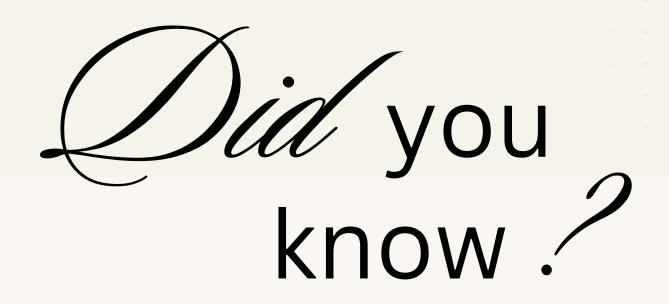

Using the iTunes Search API, create an object-oriented Python application to interact with it.

- Allow the user to search for music by entering the name of the song.
- Display the search results in a clear and user-friendly format, including details such as track name, artist name, album name, and a link to listen to the track on iTunes.

The iTunes Search API is open and does not require authentication or API tokens for basic functionality.

url = f"https://itunes.apple.com/search?term={track_name}&media=music"
